It can also be used as a reagent to determine specific T cell subpopulations, in medicament to treat or prevent immunological diseases, preferably autoimmune diseases, especially diabetes, to produce antigens, especially immunogens or tolerogens and to isolate specific T cell subpopulations, which can be used to produce antigens or for reinjection, optionally after inactivation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human 65 kD glutamine decarboxylase peptide.

PT diabetes mellitus patients

PS Disclosure; Fig 3; 53pp; English.

CC The sequence given is a glutamic acid decarboxylase (GAD65). GAD65

CC can be used for the diagnosts and therapy of patients with autoimmune

CC diseases, esp. insulin-dependent diabetes mellitus (IDDM) and "stiff

CC man" syndrome. It is possible to use either the entire GAD65 protein

CC or polypeptide fragments of it for the immunological detection of

CC autoantibodies to GAD65 which are indicative of IDDM and other auto-

cm immune diseases. The production of this sequence by recombinant DNA

CC technology allows large scale production of eukaryotic GAD65 in its

native from without the need for separation form other proteinaceous

W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Donie F, Endl J, Pozzilli P, Stahl WPI: 97-088254/09.

                                                                        The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59517) were determined. New soluble fragments of GAD65 (R59518-25) were prepared by deletion/substitution mutagenesis. These fragments are free of N-terminal amino acid that limit solubility. Different fragments contain epitopes for different classes of GAD65 autoantibodies.
                                                                                                                                                                                                                                               New soluble fragments of glutamic acid decarboxylase used for the diagnosis and treatment of insulin deperdiabetes mellitus and stiff man syndrome.

The wooluble fragments of glutamic acid decarboxylase protein -

grused for the diagnosis and treatment of insulin dependent diabetes mellitus and stiff man syndrome.

Bisclosure; Fig. 1; 73pp; English.

The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59517) were determined. New soluble fragments of GAD65 (R59517) were determined by deletion/substitution mutagenesis. The C-terminally deleted mutants given in R59524-25 are able to recognize IDDM autoantibodies having the specificity of MICA1/MICA3. These mutants also have some N-terminal modifications or MICA2. These mutants also have some N-terminal modifications or MICA2. These mutants also have some N-terminal modifications or MICA2. These mutants also have some N-terminal modifications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Heakkeskov S, Kim J, Namchuk M, Richter W, Shi Y;

PT New Soluble fragments of glutamic acid decarboxylase protein - PT New Soluble fragments of glutamic acid decarboxylase protein - PT diabetes mellitus and stiff man syndrome.

PT Used for the diagnosis and treatment of insulin dependent pt diabetes mellitus and stiff man syndrome.

PT Disclosure: Fig. 1; 73pp; English.

CC (R59517) were determined. New Soluble fragments of GAD65 (R59517) were prepared by deletion/substitution

CC (R59518-25) were prepared by deletion/substitution

CC mutagenesis. These fragments are free of N-terminal amino acids that limit solubility. Different fragments contain epitopes for CC different classes of GAD65 autoantibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δÃ

Disclosure; Fig. 1; 73pp; English.

The amino acid sequences of human GAD65 (R59516) and rat GAD65 (R59519) were determined. New soluble fragments of GAD65 (R59518-25) were prepared by deletion/substitution mutagenesis. These fragments are free of N-terminal amino acids that limit solubility. Different fragments contain epitopes for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       02-DEC-1993; U11705.

This sequence represents the rat glutamic acid decarboxylase protein GAD65. The invention relates to soluble fragments of a GAD65 protein that are specifically reactive with a GAD65 autoantibody (AAb), where the fragment is at least 99% pure and the AAb binds to a conformational epitope of the fragment. The soluble GAD65 fragments can be used to distinguish between insulin-dependent diabetes mellitus (IDDM) and stiff man syndrome. They can also be used for diagnosis and treatment of IDDM and stiff man syndrome. The fragments can distinguish different temporal stages in the progression of IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (BAEK/) BAEKKESKOV (KIMJ/) KIM J. PT Immunoassay for GAD65 auto-antibodies - used for diagnosis of immunoassay for GAD65 protein sequence. The invention provides tabletes and stiff man syndrome PS Examples; Fig 1; 31pp; English.

CC This represents a human GAD65 protein sequence. The invention provides coluble fragments of GAD65 that are specifically reactive with at least CC one class of GAD65 autoantibody. The fragments are substantially free of CN-terminal amino acids that would otherwise limit solibility. Different CC fragments contain different epitopes for different classes of GAD65 autoantibodies. These fragments are used in the methods of the invention CC diagnosing or monitoring insulin-dependent diabetes mellitus (IDDM) and CC stiff man Syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-FEB-1999 (first entry)
Human GAD65 protein sequence.
GAD65; autoantibody; soluble; detection; diagnosis; insulin-dependent diabetes mellitus; stiff man syndr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Examples; Fig 1; 31pp; English.

This represents a human GAD65 protein sequence. The invention provides soluble fragments of GAD65 that are specifically reactive with at least one class of GAD65 autoantibody. The fragments are substantially free of N-terminal amino acids that would otherwise limit solubility. Different fragments contain different epitopes for different classes of GAD65 autoantibodies. These fragments are used in the methods of the invention for detection of GAD65 autoantibodies. The methods are used for diagnosing or monitoring insulin-dependent diabetes mellitus (IDDM) and stiff man syndrome.
                                                                                                                                       Human GAD65 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the human glutamic acid decarboxylase protein GABD5. The invention relates to soluble fragments of a GABD5 protein tha are specifically reactive with a GABD5 autoantibody (AAb), where the fragment is at least 9% pure and the AAb binds to a conformational epitope of the fragment. The soluble GABD5 fragments can be used to distinguish between insulin-dependent diabetes mellitus (IDDM) and stiff man syndrome. They can also be used for diagnosis and treatment of IDDM and stiff man syndrome. The fragments can distinguish different temporal stages in the progression of IDDM.
                                                                                                                                                                                                                                                                            Example 1; Fig 3; 100pp; English. 086482 encode R71733 and R79105, rat and human glutamic 086481 and 086482 encode R71733 and R79105, rat and human glutamic acid decarboxylase (GAD65) respectively, from which the GAD65 fragments described in R72261-R72298 were derived. These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autolmmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           24-AUG-1994; U09478.

                                                                                                                                                Claim 3; Page 13-15; 24pp; English.

A modified human glutamic acid decarboxylase (GAD) (W14915) has the native lysine residue at amino acid position 396 replaced by arginine. It is obtd. by site-directed mutagenesis (see also arginine. It is obtd. by site-directed mutagenesis (see also consisted) of native human GAD65 cDNA and expression of the mutant DNA (M5456) of native human GAD65 cDNA and expression of the mutant DNA (M5456) in transformed host cells. Lys 396 is critical for enzyme activity. By replacing it with an amino acid incapable of Schiff base formation, immunoreactivity is maintained but enzyme activity is reduced or lost, so minimising the risk of toxicity. The modified GAD can be used to treat and/or prevent autoimmune disorders such as insulin-dependent diabetes mellitus (IDDM) and other diseases, e.g. neurological diseases, esp. in individuals othering a genetic predisposition for IDDM or with an increased antibody titre against GAD.

Proc. Natl. Acad. Sci. U.S.A. (1991) 88:8337-8341 Cloning and primary structure of a human islet isoform of glutamic acid decarboxylase from chromosome 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genomics (1994) 21:222-228
The exon-intron organization of the genes (GAD1 and GAD2) encoding two human glutamate decarboxylases (GAD-67 and GAD-65) suggests that they derive from a common ancestral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Characterization of a linear epitope within the human pancreatic 64-kba glutamic acid decarboxylase and its autoimmune recognition by sera from insulin-dependent diabetes mellitus patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Proc. Natl. Acad. Sci. U.S.A. (1992) 89:2115-2119
Two human glutamate decarboxylases, 65-kDa GAD and 67-kDa GAD, are each encoded by a single gene.
                                                                                                                                                                                                                     #status

NT This enzyme (GAD) catalyzes the formation of an inhibitory
rhis enzyme (GAD) catalyzes the formation of an inhibitory
gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.
it has several isoforms, each encoded by a separate gene.
IFICATION #superfamily human glutamate decarboxylase
carbon-carbon lyase; carboxy-lyase; phosphoprotein; pyridoxal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          174 TLKYGVRTGHPRFFNQLSTG 193

Natl. Acad. Sci. U.S.A. (1992) 89:2115-2119
Two human glutamate decarboxylases, 65-kDa GAD and
GAD, are each encoded by a single gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bu, D.F.; Erlander, M.G.; Hitz, B.C.; Kaufman, D.L.; Wagner-McPherson, C.I

COMMENT This enzyme (GAD) catalyses the formation of an inhibitory
neurotransmitter gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene. GAD has
also been implicated as an autoantigen in autoimmune disease
                                                                                                                                                                                                  RESULT

Expression of the neurotransmitter-synthesizing of
gluttamic acid decarboxylase in male germ cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dyrberg, T.; Madsen, O.D.

Proc. Natl. Acad. Sci. U.S.A. (1991) 88:8754-8758

Cloning, characterization, and autoimmune recognition of islet glutamic acid decarboxylase in insulin-dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genomics (1994) 21:222-228

The exon-intron organization of the genes (GAD1 and GAD2) encoding two human glutamate decarboxylases (GAD-67 and GAD-65) suggests that they derive from a common ancestra

this sequence has been revised in reference A46758
This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each enroded by a constant
                                                                                                                                                                                                                                                                                                                                      idues 156-200,'F',202-300,'K',302-384,'L',386-510 ##label JA2
This enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid,
it has several isoforms, each encoded by a separate gene.
                                                                            15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    16;

MMENT This enzyme (GAD) catalyzes the formation of an inhibitory

neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;

it has several isoforms, each encoded by a separate gene. GAD has

also been implicated as an autoantigen in autoimmune disease

#Tris enzyme (GAD) catalyzes the formation of an inhibitory
neurotransmitter, gamma-aminobutyric acid, from L-glutamic acid;
it has several isoforms, each encoded by a separate gene.
 ##residues 1-510 ##label JAC

BINDING
 binding and assembly of succinate: quinone oxidoreductase (complex II).";

MOI. Microbiol. 4:1045-1056(1990).

-i- FUNCTION: DI-HEME CYTOCHROME OF THE SUCCINATE DEHYDROGENASE COMPLEX. THE MID-POINT REDOX POTENTIAL IS +65MV.

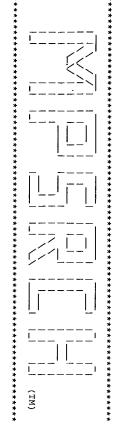

-i- PATHMAY: TRICARBOXYLIC ACID CYCLE.

-i- SUBUNIT: PART OF AN ENAYME COMPLEX CONTAINING THREE SUBUNITS:

A FLAVOROTEIN, AN IRON-SULFUR PROTEIN AND CYTOCHROME B-558.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
